

Understanding Customer & Product Churn in Online Grocery Business

Presented by Sumanth Reddy Kota

Why Do Customers Really Churn?

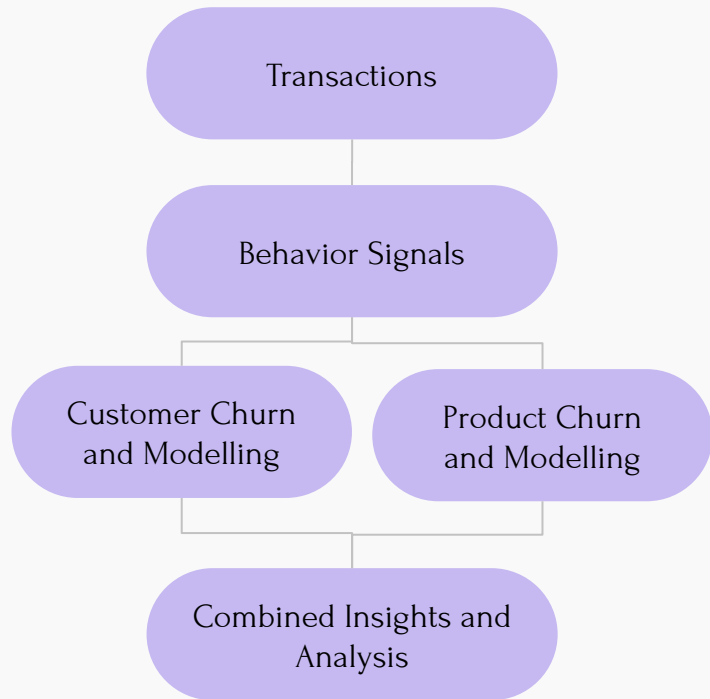

Retention is a Two-Sided Problem

- Online grocery platforms operate at massive scale.
- Predicting what users buy is relatively easy.
- Understanding why they leave is much harder.
- Churn happens gradually, not suddenly.
- Product experience silently shapes customer behavior.

**Churn builds silently
through behavior**

A New Way to Understand Churn

- Traditional models treat churn as separate problems.
- We connect customer and product behavior to get a unified view.
- We use transaction signals like recency, frequency, and reorder patterns.
- This allows us to predict both customer churn and product demand decline.
- We link these interactions to generate actionable insights

Behavioral patterns drive both customer and product churn

Turning Data into Retention Strategy

1

Identify **high-risk**
customers early

2

Detect **products**
losing demand

3

Link churn to
behavioral signals

4

Reveal
category-level
risk patterns

5

Enable **targeted,**
data-driven
interventions

Churn isn't random! It is predictable, explainable, and preventable!

We don't just detect churn, we help stop it!

THANK YOU!

Let's bring this to real-world systems

We're building Skeptics to help businesses understand and act on churn signals in real time.
